

**Astudy on Order Statistics from Nonidentically Distributed Kumaraswamy Variables**

Z. AL-Saiary

Department of Statistics, College of Science, King Abdulaziz University  
zakeia@hotmail.com

**Abstract:** In this work I deduced the moments of order statistics of independent nonidentically (inid) distributed Kumaraswamy random variables. Numerical calculations for different values of the parameters from this distribution are given. I computed the first two moments and the variance of the second order statistics of sample size  $n = 3$ . The last order statistics of sample size  $n = 2$  in the presence of multiple outliers are obtained. All calculations are tabulated. Graphs of pdf, cdf for the  $r^{\text{th}}$  (inid) order statistics are found.

[Z. AL-Saiary. **Astudy on Order Statistics from Nonidentically Distributed Kumaraswamy Variables.** *Academ Arena* 2016;8(10):27-32]. ISSN 1553-992X (print); ISSN 2158-771X (online). <http://www.sciencepub.net/academia>. 2. doi: [10.7537/marsaaj081016.02](https://doi.org/10.7537/marsaaj081016.02).

**Key words:** Order statistics, Moments, non-identically distributed, Kumaraswamy distribution.

**Introduction**

There are three trends have emerged in the literature to obtain moments of order statistics of (inid) distributed random variables. One of these trends is initiated by (Balakrishnan, 1994). He exploited the known relation between the probability density function (pdf) and the cumulative distribution function (cdf). Other trend using survival function, this trend establish by Barakat and Abdelkader (2003). Last trend was established by Jamjoom and Alsaary (2011). In this last trend researchers using the moment generating function technique. In this paper we computed the moments of OS using from INID distributed Kumaraswamy random variables.

The study of OS from INID rvs is started in the literature by (Vaughan and Venables, 1972; David, 1981; Bapat and Beg, 1989; David and Nagaraja, 2003). (Balakrishnan, 1994) derived recurrence relations for single and product moments of OS from INID rvs for the Exponential distribution. Childs and Balakrishnan (2006) derived the moments of OS from

INID rvs for Logistic distribution. (Mohamed *et al.*, 2007) else applied Balakrishnan method for doubly truncated Lomax, Weibull-Gamma, Burr XII and for general class of distributions. The second trend was applied by (Barakat and Abdelkader, 2000) in weibull distribution and then they generalized this method in (2003) and used it in Erlang distribution. Jamjoom and AL-Saiary (2012) applied it to beta type I with three parameters random variables. The survival function of Gamma and Beta distributions used by Abdelkader (2004) and (Abdelkader, 2008) to compute the moments of OS using from INID distributed Kumaraswamy random variables. AL-Saiary (2015) applied the third trend to Standard type II Generalized logistic random variables.

**Kumaraswamy Distribution**

The probability density function of a random variable  $X$  from Kumaraswamy distribution is given by:

$$f(x) = \begin{cases} a b x^{a-1} [1-x^a]^{b-1}, & a > 0, b > 0, 0 \leq x \leq 1 \\ 0, & \text{otherwise} \end{cases}$$

The cumulative distribution function is given as:

$$F(x) = 1 - [1 - x^a]^b, \quad a > 0, b > 0, 0 \leq x \leq 1$$

$a$  and  $b$  are shape parameters. See Kumaraswamy (1980).

**Nonidentical Order Statistics from Kumaraswamy Distribution:**

Let  $X_1, X_2, \dots, X_n$  be independent random variables having cumulative distribution functions  $F_1(x), F_2(x), \dots, F_n(x)$  and probability density functions  $f_1(x), f_2(x), \dots, f_n(x)$ , respectively. Let  $X_{1:n} \leq X_{2:n} \leq \dots$

$X_{n:n}$  denote the order statistics obtained by arranging the  $n X_i$ 's in increasing order of magnitude. Then the p.d.f and the c.d.f of the  $r$ th order statistic  $X_{r:n}$  ( $1 \leq r \leq n$ ) can be written as:

$$f_{r:n}(x) = \frac{1}{n! \beta(r, n-r+1)} \sum_p \prod_{a=1}^{r-1} F_{i_a}(x) f_{i_r}(x) \prod_{c=r+1}^n \{1-F_{i_c}(x)\} \quad (2)$$

Where  $\sum_p$  denotes the summation over all  $n!$  permutations  $(i_1, i_2, \dots, i_n)$  of  $(1, 2, \dots, n)$ . (Bapat and Beg, 1989) put it in the form of permanent as:

$$f_{r:n}(x) = \frac{1}{n! \beta(r, n-r+1)} \text{per} \begin{bmatrix} \underbrace{F(x)}_{r-1} & \underbrace{f(x)}_1 & \underbrace{\{1-F(x)\}}_{n-r} \end{bmatrix} \quad (3)$$

$$F_{(r)}(x) = \sum_{j=r}^n \sum_{p_j} \prod_{a=1}^j F_{i_a}(x) \prod_{a=j+1}^n [1-F_{i_a}(x)] \quad (4)$$

$\sum_{p_j}$  is all permutations of  $(i_1, i_2, \dots, i_n)$  for  $(1, \dots, n)$  which satisfy  $i_1 < i_2 < \dots < i_j$  and  $i_{j+1} < i_{j+2} < \dots < i_n$ . And using permanent as:

$$F_{(r)}(x) = \sum_{i=r}^n \frac{1}{(n+1)! \beta(i+1, n-i+1)} \text{per} \begin{bmatrix} F_1(x) & 1-F_1(x) \\ \vdots & \vdots \\ \underbrace{F_n(x)}_i & \underbrace{1-F_n(x)}_{n-i} \end{bmatrix}, \quad -\infty < x < \infty \quad (5)$$

we can obtain the p.d.f. and the c.d.f. of the *first* INID OS of KW distribution when  $n = 3$  from eq (1) and (2) IN (3) AND (4) using (Permanent) and Mathematica Program as:

$$f_{1:3}(x) = a \sum_{i=1}^3 b_i x^{a-1} [1-x^a]^{\sum_{i=1}^3 b_i}, \quad x > 0, a > 0, b > 0 \quad (6)$$

$$F_{1:3}(x) = 1 - [1-x^a]^{\sum_{i=1}^3 b_i}, \quad x > 0, a > 0, b_i > 0 \quad (7)$$

**Figure 1:** Graphs of p.d.f. and c.d.f. of (inid) OS. from KW distribution for selected values of  $b_2 = 1, b_3 = 2, b_1 = 1, 2, 3, 4, 5, n = 5, a = 0.5$

**Moments of OS from INID Kumaraswamy rvs:**

Now, we consider the case when the variables  $X_1, X_2, \dots, X_n$  be INID rvs having cdfs:

$$F(x) = 1 - [1-x^a]^{b_i}, \quad a > 0, b_i > 0, 0 \leq x \leq 1, i = 1, 2, \dots, n \quad (4)$$

Now We will use theorem of (Barakat and Abdelkader, 2003) to deduce the moments of OS from INID rvs arising from our distribution.

**Theorem 1:** Let  $X_1, X_2, \dots, X_n$  be independent nonidentically distributed rvs. The  $k^{\text{th}}$  moment of all order statistics,  $\mu_{r:n}^{(k)}$ , for  $1 \leq r \leq n$  and  $k = 1, 2, \dots$  is given by:

$$\mu_{r:n}^{(k)} = \sum_{j=n-r+1}^n (-1)^{j-(n-r+1)} \binom{j-1}{n-r} I_j^{(k)} \quad (5)$$

Where:

$$I_j^{(k)} = \sum_{1 \leq i_1 < i_2 < \dots < i_j \leq n} \dots \sum_{t=1}^j \int_0^{\infty} x^{k-1} G_{i_t}^{(j)}(x) dx, \quad j=1, 2, \dots, n \quad (6)$$

$G_{i_t}(x) = 1 - F_{i_t}(x)$  with  $(i_1, i_2, \dots, i_n)$  is a permutation of  $(1, 2, \dots, n)$  for which  $i_1 \leq i_2 < \dots < i_n$ .

The following theorem gives an explicit expression for  $I_j^{(k)}$  when  $X_1, X_2, \dots, X_n$  are OS from INID Kumaraswamy rvs.

**Theorem 2:** For any real numbers  $a, b > 0$ ,  $1 \leq r \leq n$  and  $k = 1, 2, \dots$

$$I_j^{(k)} = \sum_{1 \leq i_1 < i_2 < \dots < i_j \leq n} \dots \sum_{t=1}^j \frac{k}{a} \beta \left( \sum_{t=1}^j b_{i_t} + 1, \frac{k}{a} \right) \quad (7)$$

**Proof:** Applying theorem 1 and using equation (4), we get:

$$I_j^{(k)} = k \sum_{1 \leq i_1 < i_2 < \dots < i_j \leq n} \dots \sum_{t=1}^j \int_0^1 x^{k-1} [1-x^a]_{t=1}^{\sum_{t=1}^j b_{i_t}} dx$$

Substituting  $y = x^a$  the above equation reduces to:

$$I_j^{(k)} = \sum_{1 \leq i_1 < i_2 < \dots < i_j \leq n} \dots \sum_{t=1}^j \frac{k}{a} \int_0^1 [1-y]_{t=1}^{\sum_{t=1}^j b_{i_t}} y^{\frac{k}{a}-1} dy$$

$$\therefore I_j^{(k)} = \sum_{1 \leq i_1 < i_2 < \dots < i_j \leq n} \dots \sum_{t=1}^j \frac{k}{a} \beta \left( \sum_{t=1}^j b_{i_t} + 1, \frac{k}{a} \right)$$

where,  $\beta(a, b)$  is the beta function defined by:

$$\int_0^1 x^{a-1} (1-x)^{b-1} dx = \beta(a, b)$$

**Remark 1:** The  $k$ th moment of the last OS  $X_{n:n}$  from INID of Kumaraswamy rvs. can be written as:

$$\mu_{n:n}^{(k)} = \sum_{j=1}^n (-1)^{j-1} I_j(k) \quad (8)$$

where,  $I_j(k)$  is defined in (7)

**Remark 2:** The  $k$ th moment of the first OS  $X_{1:n}$  from INID of Kumaraswamy rvs. can be written as:

$$\mu_{1:n}^{(k)} = I_n(k) \quad (9)$$

Where:

$$I_n(k) = \frac{k}{a} \beta\left(\sum_{i=1}^n b_i + 1, \frac{k}{a}\right), a > 0 \quad (10)$$

**Remark 3:** For the Independent Identically Distributed (IID) case, we used theorem 2.  $I_j(k)$  is written as:

$$I_j(k) = \frac{k}{a} \binom{n}{j} \beta\left(jb + 1, \frac{k}{a}\right) \quad (11)$$

### *Numerical calculations for Kumaraswamy distribution:*

For  $k = 1$ , we deduced the following results:

#### Example 1

Let  $n = 3$  and  $a = 1$ ,  $b_1 = 1$ ,  $b_2 = 2$ ,  $b_3 = (1(0.5) 4)$ . Table 1 shows the results.

**Table 1:** represents the first two moments and the variance of the median of inid OS when  $n = 3$  and  $a = 1$ ,  $b_1 = 1$ ,  $b_2 = 2$ ,  $b_3 = (1(0.5) 4)$ .

| $b_3$    | 1         | 1.5       | 2         | 2.5       | 3         | 3.5       | 4         |
|----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|
| $E(x)$   | 0.433333  | 0.3943    | 0.366667  | 0.346348  | 0.330952  | 0.318998  | 0.309524  |
| $E(x^2)$ | 0.233333  | 0.195904  | 0.171429  | 0.154701  | 0.142857  | 0.134225  | 0.127778  |
| $V(x)$   | 0.0455556 | 0.0404315 | 0.0369841 | 0.0347439 | 0.0333277 | 0.0324651 | 0.0319728 |

For example in (5) Let  $n = 3$  and  $a = 1$ ,  $b_1 = 1$ ,  $b_2 = 2$ ,  $b_3 = 3$ . the  $k$ th moment of the median  $X_{2:3}$  is given by:

$$\begin{aligned} \mu_{2:3}^{(k)} &= \sum_{j=2}^3 (-1)^{j-2} \binom{j-1}{1} I_j(k) \\ &= I_2(k) - 2I_3(k) \end{aligned} \quad (18)$$

From (7):

$$\begin{aligned}
 I_2(k) &= k \sum_{1 \leq i_1 < i_2 \leq 3} \dots \sum_{t=1}^2 \beta(\sum_{t=1}^2 b_{i_t} + 1, k) \\
 &= k [ \beta(b_1 + b_2 + 1, k) + \beta(b_1 + b_3 + 1, k) + \beta(b_2 + b_3 + 1, k) ] \\
 &= k [ \beta(4, k) + \beta(5, k) + \beta(6, k) ]
 \end{aligned}
 \tag{19}$$

$$\begin{aligned}
 I_3(k) &= k \sum_{1 \leq i_1 < i_2 < i_3 \leq 3} \dots \sum_{t=1}^3 \beta(\sum_{t=1}^3 b_{i_t} + 1, k) \\
 &= k \beta(b_1 + b_2 + b_3 + 1, k) \\
 &= k [ \beta(7, k) ]
 \end{aligned}
 \tag{20}$$

Substituting (19) and (20) in (18),  $\mu_{2:3}^{(k)}$  is then can be obtained.

Table 1 introduces the first two moments and the variance of the median from sample size  $n = 3$  arising from **Kumaraswamy distribution**. These computations are done when  $(a= 1, b_1 = 1, b_2 = 2, b_3 = (1(0.5) 4)$ .

**Example 2**

Setting  $n = 2, a = 2$ , and  $b_1 = 1 (1) 5, b_2 = 1 (1) 5$ , in Theorems 1 and 2, we get the following tables.

Table (2): The mean of the last inid OS of sample size  $n = 2$  arising from **Kumaraswamy distribution**

| $b_1 \backslash b_2$ | 1        | 2        | 3        | 4        | 5        |
|----------------------|----------|----------|----------|----------|----------|
| 1                    | 0.8      | 0.742857 | 0.71746  | 0.703608 | 0.695083 |
| 2                    | 0.742857 | 0.660317 | 0.621068 | 0.59869  | 0.584482 |
| 3                    | 0.71746  | 0.621068 | 0.573293 | 0.545233 | 0.527013 |
| 4                    | 0.703608 | 0.59869  | 0.545233 | 0.51316  | 0.491984 |
| 5                    | 0.695083 | 0.584482 | 0.527013 | 0.491984 | 0.468557 |

For example, when  $k = 1, a = 2, b_1 = 2, b_2 = 3$

$$\mu_{2:2} = I_1(1) - I_2(1)
 \tag{23}$$

From (7):

$$\begin{aligned}
 I_1(1) &= \frac{1}{2} \sum_{i=1}^2 \beta(b_i + 1, \frac{1}{2}) \\
 &= \frac{1}{2} [ \beta(b_1 + 1, \frac{1}{2}) + \beta(b_2 + 1, \frac{1}{2}) ] \\
 &= \frac{1}{2} [ \beta(3, \frac{1}{2}) + \beta(4, \frac{1}{2}) ]
 \end{aligned}
 \tag{24}$$

$$\begin{aligned}
 I_2(1) &= \frac{1}{2} \beta(\sum_{t=1}^2 b_{i_t} + 1, \frac{1}{2}) \\
 &= \frac{1}{2} \beta(b_1 + b_2 + 1, \frac{1}{2}) \\
 &= \frac{1}{2} \beta(6, \frac{1}{2})
 \end{aligned}
 \tag{25}$$

Substituting (24) and (25) in (23),  $\mu_{2:2}^{(k)}$  is then can be obtained.

**Table (3):** The second moment of the last inid OS of sample size  $n = 2$  arising from *Kumaraswamy distribution*

| $b_1 \backslash b_2$ | 1        | 2        | 3        | 4        | 5        |
|----------------------|----------|----------|----------|----------|----------|
| 1                    | 0.666667 | 0.583333 | 0.55     | 0.533333 | 0.52381  |
| 2                    | 0.583333 | 0.466667 | 0.416667 | 0.390476 | 0.375    |
| 3                    | 0.55     | 0.416667 | 0.357143 | 0.325    | 0.305556 |
| 4                    | 0.533333 | 0.390476 | 0.325    | 0.288889 | 0.266667 |
| 5                    | 0.52381  | 0.375    | 0.305556 | 0.266667 | 0.242424 |

**Table (4):** The variance of the last inid OS of sample size  $n = 2$  arising from *Kumaraswamy distribution*

| $b_1 \backslash b_2$ | 1         | 2         | 3         | 4         | 5         |
|----------------------|-----------|-----------|-----------|-----------|-----------|
| 1                    | 0.0266667 | 0.0314966 | 0.0352507 | 0.0382698 | 0.0406696 |
| 2                    | 0.0314966 | 0.0306475 | 0.0309414 | 0.0320462 | 0.0333806 |
| 3                    | 0.0352507 | 0.0309414 | 0.0284776 | 0.0277215 | 0.027813  |
| 4                    | 0.0382698 | 0.0320462 | 0.0277215 | 0.0255557 | 0.024618  |
| 5                    | 0.0406696 | 0.0333806 | 0.027813  | 0.024618  | 0.022879  |

Table 2 represents the mean of the last OS of sample size  $n = 2$  arising from *Kumaraswamy distribution*. These computations are done when ( $n = 2, a = 1,$  and  $b_1 = 1$  (1) 5,  $b_2 = 1$  (1) 5).
