Abstract: The Author is a doctor of the technological and organizational sciences professor. He studied problems of new science “Theoretical Technology” more than thirty years. When he arrived to the USA, he saw that quality of the technology country is degrading and some states will say about independent very soon, because the country is going to the destruction. The Author published in three book some knowledge of new science to protect country from destruction: 1. “The Technological Laws and Intellectual Conquest of the USA”-2009; 2. “Technological Mistakes and Reserves of the Government System”-2012; 3. “The Crisis of Economic Knowledge”-2012. Using knowledge of new science allowed scientists to have a new view at the condition of the country.

New science is the main science of the century. The knowledge of this science already allow to create the best pace of development of the country in the world, have the best efficiency of businesses and rich population, the best results of science researches, and etc.

[V. Nesnov. **The Tecnological Reserves Of The Development.** *Nat Sci* 2014;12(6):58-64]. (ISSN: 1545-0740). <http://www.sciencepub.net/nature>. 9

Keywords: tecnological reserves , development

Every science accumulates and materializes own knowledge by the using some technologies. The Theoretical Technology allows to unite the knowledge of all sciences in alone technological system of knowledge and classifies all sciences according to some parameters. This science studies human-technological system: cities, states, countries, population of the world, as especial systems in which every person realized his own abilities and satisfies needs according to some technologies. New theory of the human-technological systems was created before it.

Any technology is materializing knowledge of some sciences. The level of the development any society depends on the volume of using knowledge materialized in the different technologies. The classification of technologies according their function divides all technologies at two groups: creative and service. The use of one of them is connected with the creation of some materialized object or subject and aids the development of the human-technological systems. The use of the second kind of technology provides the attendant service for various aspects of the functioning human-technological systems. Accordingly, all knowledge using in such technologies and the sciences creating of this knowledge is dividing at creating and servicing. The creative sciences are: math, physics, chemistry, all technical, biology and other sciences which studies: interaction, movement, change connecting with life and actions of the persons in the system. The service sciences are: geological,

ecological, economical, juridical, information, ..., social, ..., political.

When the knowledge of Theoretical Technology wasn't developed every science could has own rates of the development and occupy “free spaces” in the humanity society. As result some service sciences have occupied the places of the creative sciences and defect of necessary knowledge began to braking the development of the society. The appearance of Theoretical Technology allows to create the order in the development of any society and determines the place every science in the development of the society. One of so sciences, for example, which occupied the place of the knowledge of technological sciences is some knowledge of economic sciences which already are braking the development of the country. The creation and development of new science allowed to understand that there are three technology of the development of the different countries in the world: technical progress, technological progress and intellectual progress. The effect of the development of any country is finishing when this country can materialize complex mechanization all production processes and creation new machineries in such processes has no additional effect. More rational is technology of the creation of new technologies, although this way needs in the higher creative intellectual potential and system must prepared it in good time. The need in the professional selection of the persons for the using in the processes of such technologies is arising together with complicate of the technologies. In this case sometimes more effective is

the creation robot or automatic machine-technology of intellectual progress.

The first plant-automatic was built in Japan in 1986. Only 2 operators were used instead more, than 500 people. The robots and automatic machine executed all other work. For the first time people could see that potential of the intellect of many creative sciences materialized in the technology of this plant is the source of the quality and quantity of the creating product, net cost, profit and other indicators what the representatives of the economic sciences could “economic indicators” before it. The quality of the technology determined by the materialized creative intellect in this system is the source of all meanings of the indicators of system.

The economic sciences can't create of the own indicators and it was the first evidence of these. They use only some technological indicators but call theirs as economical, although they don't speak about it. All economic indicators are only one of many groups of indicators of the quality of using technology and this quality determines their meanings. All knowledge of the economic sciences is only service knowledge and they can't create of the own indexes. The knowledge of theoretical technology was another argument that the economic sciences are only service sciences and they have no some relation to the creative technologies of the different system of the management.

The development of the country and “economic development” of it is different conceptions. The management by the development of the country means the process of the improvement of the quality of the technology functioning system and all technological indexes. That is way any management by the development of humanity-technological system must have creative technology and quality of this technology has to be better than in society. The management by the “economic development” human-technological system means the process of the improvement of the “economic indexes”, which are only some part of all technological indicators. Naturally, the economists have no necessary technological knowledge and they have no connection with human in such systems. That is why manage by the “economic development” of the country means the process of the management by nothing and this management has no need in special technological knowledge. The people of the service intellect (economists, lawyers and others) can manage only “economic development” of the country, but they can't manage by the quality of technology of functioning human-technological system providing its development. Any government system which manages by “economic development” has not sufficiently creative knowledge for the creation reasonable technology of the development of country

and can do it only at the level of own knowledge providing service technologies.

All negative processes in the technological quality of the country, degradation of this quality, failures in the technology of functioning system are result of such management. These people don't understand even, for example, that every law has technological content pronounced in the words, that technological content can determine only by the diagnosis of the technological quality of using technology and expose of need in these content. The lawyers have to wrap up this content in the words only. Unfortunately, the system of government has no necessary technological knowledge and it doesn't know of these needs. The Congress forces to use technology of “yesterday day” when creates laws after arising negative events and it creates their at the base subjective opinions of the people servicing intellect that don't always satisfy all needs of technological quality.

The economic sciences have single connection with human in the human-technological systems. The conception “labor”, “payment of labor”, “production of labor” and some other analogical conceptions connected with this word are such connection. However, this concept is abstract concept because it has no measurement. The economists used this concept several centuries but could not create the unit of measuring of this concept. This concept is process and always has technology. This concept is more technological than economical, but the technologists have own concept- “work”. Any job is process of the materialization human intellect and always can be measuring. The concept “labor” isn't existence because it is concept of the human interplay what can't be measure and it has no content. The defect of the technological knowledge allowed by the economists hung at society conscience and other ignorant concepts, for example, “economy of the country”, “economic potential of the country” and some other although all economic meaning are only one of the results in the different technologies and far don't always is by the first elements in the technological systems.

The representatives of the economic sciences have not connection with human, has enormous defect of the technological knowledge but would like to manage by the functioning human-technological system. Naturally, defect of the technological knowledge don't allow them to make technological diagnosis of the quality of using technology to create optimal structure of the management and optimal complex of the actions for the management by the technological quality. The defect technological knowledge creates problems in the technology of the functioning country and representatives of the

economic sciences call technological problems by economic and try to decide their though they can do it only at the level of own service knowledge. The representatives of the economic sciences have neither relation to creative technology of the management by the country according to the level of own knowledge and can manage only “economic development”, that means nothing.

The children have and show different abilities to study math, physical, chemistry and other sciences what need in more deep thinking and are base for the forming of the creative intellectual potential in the school more. Later, more ability of them will continue to formation of the creative intellect in the technological universities where they study and other exact sciences what need in the deep thinking. The people who have not such abilities can continue to formation their ability in the economic university because their programs have only a little math and they can learn the level using math knowledge but in these programs there are not sciences the learning what needs in more deep thinking. The people who can't study even this level of knowledge continue to formation their abilities in the study of the knowledge of the classical sciences: juridical, information and etc. If the government system allow to the people of service intellect have better life than the people of the creative intellect a long time than some quantity of the people of creative intellect will have service professions. The country will have worse rates of the development and abilities of the people will not sufficiently used.

Any service technology needs in the creative intellect too, but the level of creative intellect has to be less than in the creative technologies, although every such profession can have of the geniuses but at the level of the own knowledge. By the way already school education divided of the people at the rational using their abilities in the creative and service technologies and allows to see more effective people for the development of the country although these processes impossible without the exclusion, because they are elements of technology of the human-technological system in which human learned insufficiently more.

The government system has technology of the functioning alike the home in what service personnel (intellect of economists, lawyers and other specialists of the service sciences) manages by the householder (creative intellectual potential providing the development of the country) at the base only subjective opinions.

The Congress can't creates in a good time optimal legislative space in system and doesn't know “when and what” law is necessary for the improvement of the technological quality of the

country when creates the next law after arising negative events. It submits annual budget at the base only subjective opinions some grope of the specialists of the service sciences without diagnosis of the technological quality of the functioning system and the creation optimal complex of actions for the development of the country, it doesn't know even optimal technological system of the taxes. It offers to the population of the country has technology of the creation of the Executive power what can't guaranty that every next Executive Power will be more effective for the development of the country and can't be unprofitable.

Analogical, the Executive Power manages by the “economic development” of the country although even such concept isn't existence, nothing know about optimal for the development country complex of actions, optimal for the development country technological system of the taxes.

The main contradiction in the country is the contradiction between by the quality of technology of the government system and functioning country. If the country already elaborated resource arising line normal law of the distribution of the possibilities of the technology of the technological progress and tries go to intellectual progress but the government system stayed too long at the level of the technical progress, when could was manage by the “economic development”. The technology of the technological progress changed country in the human-technological system and changed role and meaning economic and other service sciences. The knowledge of the economic sciences became so a little for the management by the system that they created crisis of economic knowledge by own insufficiently competence and their management by the country makes enormous damages already several decades.

The damages country are so enormous from using obsolete technology of the management that they can't be measured in the usual unites: the systems of management retarded the development of the country and allowed other countries overtake and leave behind according to the level of the development and began intellectual conquest country what arrived already second technological level; transferred technological quality of the functioning country from the development to the degradation, that accompanied by the arising other negative processes; changed the technology of the monetary circulation of the country in the unprofitable for the population of country and etc.

The degradation of the technological quality is very dangerously for the country, because if this process had arising one time, it will aim to doing the positive acceleration and usually finishing by the destruction system. For example, the Soviet Union

elaborated the resource of the technical progress in 60-years and could not come to the technological progress. The system continues to create new machinery, but “economical indexes” didn’t become better. Insufficiently competence system of the government in this case gave more domination for the realization of the economic knowledge and the economists didn’t understand what was happen with system began create different experiment when the degradation of the technological quality was growing very quickly. The Soviet Union as system was destruction.

Later already in Russia technological system with outside regulation needs in the change it of the technological quality by the coming to the technology inside regulation. However technological problem of the human-technological system took to decide economists again although knowledge of these sciences have not connection with human and is only one of the service systems-elements in the technological problems. The result of the external interference was the creation new third technology in which all the negative sides of the human life: stealing, bribery and etc. became by the elements of the quality using technology and was made nothing to stop the degradation of the human-technological system.

The modern system of the government creates some movement to stop degradation of the technological quality and transfer human-technological system to the technology of the development but all actions it creates at the level of the service sciences. This system according to the level of the creative intellect occupies some place in the beginning of the arising line of the normal law of the distribution of the possibilities of technology of the technological progress and needs in the optimal technology of the development to have very high rates of the development during interval 30-50years. The more fast way to it is technological diagnosis of the quality of the using technology creating specialists of the theoretical technology, the creation necessary complex of the actions and necessary reforms.

The management of the “economic development” of the country is result of the using service intellect in the government systems. It can’t provide rational development of the country and so management will be accompanied by the beginning of the degradation of the technological quality definitely and by the creating of the negative processes. One of such processes will reduce of the trust to the systems of the government. The management by the “economic development” is source of the social tension in the society.

The negative processes will have the dynamics functioning and worse the technological quality of the

system, worse the possibilities of the managing system to decide the problems of the improvement even some elements of the technological quality of the functioning country and in some times the system of management will can’t decide the problems of the country. For example, one of so problems may be the inflation. If the government system manages by the “economic development”, it will create inflationary process definitely. The impoverishment and social stratification of the society is one of the results of the management by the “economic development” and, unfortunately, service intellect of the government system can’t already to stop inflationary and other negative processes. However, results of so management can correct, if specialists of the theoretical technology will do diagnosis of the technological quality and create optimal complex of the actions for the improvement of the technological quality of the functioning country and quality of the detrimental technology of the monetary circulation. Any system of the management by the “economic development” doomed to disappear creating of these process enormous damages to own country and its population. The degradation of the technological quality is complex all negative processes creating insufficiently technological competence of the government system. The US has so level of the degradation of the technological quality that some rich states will say about independent very soon. The need in the reforms government system is so huge that it required urgent actions for the improvement of the state system.

If say about competence political parties of the country according to last elect of the President, when two main parties offered to own population to elect at this post lawyers (person of the service intellectual potential), than can see that leaders of these parties have technological potential approximately equality and it needs in the improvement. Neither party make diagnosis of the technological quality of the country to current time, they don’t know optimal complex of the actions and optimal for the development of the country technological system of the taxes although continue superfluous politicize the government system. They can do it at the level of knowledge only of the technology of technical progress. Neither political party has responsibility even economical before own population according effective or detrimental of the own presidents and one of the party offered elect twice the president person with intellectual coefficient 92 and 93 that is below than middle coefficient of the nation. Nobody knows what critical intellectual coefficient must have the place of the president, vice-president, the place in the Congress in the technological system of the country. About 30 ago scientists administrated that every place in the

government system has some critical intellectual potential and person of this place can be effective only if he has such coefficient higher than critical. Than higher his coefficient by that he will more effective. The level of the critical intellect of every place depends on the quality of technology of functioning system and needs in the periodical diagnosis (better to every president election) that using system democratic creation of the government system was effective in these changing conditions.

The management by the “economic development”, that means nothing, isn’t accidentally. It appeared and was used at the level development of country according to the technology of the technical progress when the role of creative intellect occupied a little meaning but money had the main role. At the level of the technological progress creative intellectual potential of nation determines of the rates of development of country and effect of any of innovation project. The monetary technologies are already service technology which can’t determine the development of country although government system wouldn’t like to understand it and continue use obsolete detrimental for the population country technology of the monetary circulation.

The country needs in the diagnosis of the technological quality of monetary manipulation. Using level technology of monetary circulation creates enormous damages for the country but stimulate of the people service intellect to take over different places in the systems of the management and conservation detrimental technology of the monetary circulation already is personal interest of the people of domination. Such systems of the management have high probability that the creative intellectual potential in their insufficiently for the effective management. Only so can explain that the country hasn’t optimal legislative space.

The technology of the monetary circulation in the world system and in the country has degrading quality and technological degradation almost always has positive acceleration and the negative processes increase own influence in it.

The monetary manipulation constantly is servicing sufficiently compound system of the interactions of the interest of population country and naturally technology of its functioning is sufficiently complex system. Although this system is service the development country but its degradation has many factor influence. It can creates failures in the technology of the functioning country, has different influence in the social system and etc. It has several indexes but one of the more important indicators is the reliability. When in the system began to arise different negative processes the economists used the reservation in the system for the provision of the reliability and

created different funds but nothing did in the technological quality of this system. The negative processes in the technological quality continue have the development and some representatives of the economic sciences already began to understand that they have insufficiently knowledge for the decision of the technological problems in the quality of this technology. The knowledge of economists is insufficiently for the technological diagnosis of the quality technology of the technological system of monetary circulation and even for the stop negative processes. They see and understand that so system of the provision of the reliability is insufficiently and already can’t provide necessary reliability of the functioning of the system of monetary manipulation. They try to hold technology of functioning of the system from the arising failures and constantly increase quantity “empty”, nothing providing, money in the manipulation. They understand that this technology of in order to avoid of the crisis today creates more probability arising beginning stronger crisis tomorrow but make it to cover of the own insufficiently competence. The using technology was changed by the economists in the “system-self-meal”, because has many negative processes: it is constantly helps to the development of inflation processes, to cheapen American dollar as world currency, help other countries change the balance of the forces in their side and etc. Today even economists already understand that they can’t change technology of the monetary manipulation and create optimal or more rational technology because they have not necessary knowledge. One times they began to manage by the technology of monetary manipulation at the level of the technical progress and would like to continue so management, although they created and continue to create enormous damages for the country and the economists understand that they can’t decide technological problems in the technological quality of the monetary manipulation but continue try to manage.

Economic knowledge insufficiently even for necessary quality of the service of the technologies of technological system of monetary circulation and the system needs in the more intellectual science that necessary already today. The knowledge of theoretical technology allow to see the need in the creation new technological science for the provision of the quality of functioning technology of the technological system of monetary manipulation.

Unfortunately, the economists don’t want to understand that technology of the monetary circulation of the country, world must satisfy by the some system requirements and it is technological system. This system has some dynamic and quality of the technology of the functioning. Naturally, more effect the country will have, if it manage by the quality of

using technology at the base of the results of diagnosis quality of the technology of country, its monetary manipulation, world and scientific prognostication of the changes in the technologies of the creating systems. The knowledge necessary for the rational of the using of possibilities country and creation optimal technology of the monetary manipulation can create only theoretical technology what united knowledge all sciences in one technological system of knowledge. So knowledge can create new science the need in what already very long time overgrown of the possibilities of economic sciences. The economical knowledge has neither relation to the management of the technological quality of the monetary circulation. It is problem only for the technological knowledge because it is one of the strong problems of the human-technological systems, problem of the technological quality of the functioning country and it services the interaction of the interest of the population in this system.

All problems of the monetary manipulation are technological problems and the decision every of them needs in the technological knowledge. Only people of the creative intellect can improve the quality of the using technology and provide the development of the country. Money can only serve the processes of the creation of new intellectual potential but can't create it. The technology "money- good -money" can't work in the conditions of the technological progress. The systems of monetary manipulations, health, information, political, and others systems are only service systems in these processes. That is why all economical forums are elementary deception of the society opinion because service intellect of economists is insufficiently for the decision technological problems at the necessary level of the quality. Characteristic, that some economists already understand it when try discuss technological problems of the monetary manipulation at these forums but, unfortunately, they can do it only at the level of economic (service) knowledge. The organization of such forums are the argument that creative intellect of the systems of management of some countries taking part in such forums and managing by the "economic development" are so below that leaders of so countries don't understand that the participation in so forums is discrediting their system of the management. Some leaders try even show to the population of the world their insufficient competence by own participation. The crisis of economic knowledge and appearance of the knowledge of "Theoretical technology" as new sciences to created problem of the responsibility of the government systems before of the own population at insufficient competence management.

Any human-technological system will have the development if it by the own functioning creates the

increment of the creative intellectual potential and its rational realization in a good time in the quality of the using technology. The optimal parameters of these two technological system determines by the quality of the technology of country, but the possibilities of the realization of these parameters depends on from other technologies including in their composition. The technology of the monetary circulation in the system is one of the so technologies. It included in at the same time in the composition of these technologies and is one of their elements. That is way the optimal parameters of the technology of monetary circulation determine by the quality two base technologies: the creation and materialization of the creating intellect and problems of the optimum of the technology of monetary manipulation are technological problems. Naturally, if the government system allows service intellect even have some relation to the functioning of technology of the monetary manipulation or interfere in this technology than probability of the additional problems and failures in its functioning will increasing very soon. The time of the economists manage by the monetary manipulation went away together with technical progress and any their attempts to continue do it is only intentional sabotage to own population and to the development of the country. The degradation of the technological quality of the functioning country and unprofitable for the population of country technology of the monetary manipulation in the system is only some of the results of such actions. However the government system doesn't want to satisfy by the requirements of the development of the country and continue functioning according to the old technology.

All service sciences have technologies of the realization own knowledge too but common for theirs -they attend or create the services for the interests of the different technological system. The technology of the monetary manipulation has creative structure, it is the element of the more compound creative technological systems, requirement of the optimal parameters, needs in the technological methods of the diagnosis and prognostication of the quality and, naturally, will more effective, if it will has technological system of the management. The economists of the own insufficiently competence are so complicated and confused it, transformation it in the a little reliable system that already urgently necessary some reforms to create effective for the population of the country technology of monetary manipulation and only later can create optimal technology because before it necessary to stop the degradation of the technological quality of the country and return it to the development.

The representatives of the economic sciences tried to slow down the development of the theoretical

technological knowledge of the different methods. That is way the creating in the technology of monetary manipulation problems is don't only their insufficiently competence but and some premeditated actions. All sciences, all technology use different level of the technological knowledge and technological sciences change our century in the technological century.

All time of the appearance economic sciences they tried to create different economic theories and every of them try to administrate the main role of the economic knowledge in the government system and own dominant influence in the system. The creation new science "Theoretical Technology" and increasing its knowledge show that service science can have some theories only connected with the quality of the attendant of the different technologies, but they haven't sufficient knowledge for the creation technological theories. For example, the knowledge of new science light administrate that well-known economic theory of Marxism was created insufficiently educated persons and can't has neither relation to the creation of the optimal quality of functioning country.

The main rich of any nation in this century is its creative intellectual potential and it can be uses for the peaceful conquest of other countries. The intellect of the creative businesses is the guarantor don't only of the own development country but and the conductor of the politic of own country in the technologies of other countries. However the mistakes of the government systems and defect technological knowledge of the economists of our system allowed to the create businesses use the rich of country according to the own wishes. For example takes China. The country had technology of the technical progress of the development and to the elaborated recourse of this technology had more than 20-30 years. The import American creative intellect in the different creative

technologies and later of other countries allowed to the country changed technology to technological progress and to pass the transitional period and cut down the own development country as minimum at 50 years. As result inside market of the country has so many products of businesses of China that native creative businesses don't always can compete even in the own country.

So manage by the creative intellectual potential of the country could be only in insufficiently technological competence system of the service management which uses political party inside country to try to convince the own population that together with next president the life in the country will better, allows the knowledge of the service science manage by the functioning of country and doesn't use even elementary technological knowledge. In this case, when technological quality of the country and monetary manipulation is degrading and all leader places in the system of the management occupied by the persons of the service intellect who can't stop even negative processes in the human-technological system, to say about the efficiency next president is very difficult and may be better say that he can be less detrimental for the development of the country.

The appearance of knowledge Theoretical Technology needs in the change of educational programs of some service sciences in the universities, change science "management" from service to creative, learning of new science, and etc. Any country which uses the knowledge of new science better will has the best rates of the development.
