**Abstract:** A Flood is an overflow of water that submerges land which is usually dry. Sometimes a river receives too much extra water, either from heavy rain or other natural disasters. When this happens, the water overflows from its normal path in the river bed and onto dry land. There are many types and ways floods can occur, including, due to Overflow Rivers, due to extreme coastal events, by natural or artificial ground saturation. However, floods are not always caused by heavy rainfall. They can result from other phenomena, particularly in coastal areas where inundation can be caused by a Flood associated with a tropical cyclone, a tsunami or a high tide coinciding with higher than normal river levels. The immediate impacts of flooding include loss of human life, damage to property, destruction of crops, loss of livestock, and deterioration of health conditions owing to water borne diseases.

Flood forecasting is the use of forecasted precipitation and stream flow data in rainfall-run off and stream flow routing models to forecast flow rates and water levels for periods from a few hours to days ahead, depending on the size of the watershed or river basin. Weather forecast can provide advance warning of a flood and seasonal forecasters can alert of a heightened chance of flooding in the coming months. I have conducted many studies on the forecasting methods of floods and invented the Global Monsoon Time Scale, Astroclimatic weather forecasting study time scales, bioforecast along with the G.R. Irlapati's Geo-scope which may also useful in predicting the dam first Floods.

**Key Words:** Global Monsoon Time Scale.

**1. Introduction:** By establishing the Global Monsoon Time Scales in accordance with the conditions of a country and maintain, impending Floods can be studied, estimated and predicted in advance. Here shows an example of method to study and predict such weather conditions.

**2. Global Monsoon Time Scale:** The global Monsoon Time Scale – a Chronological sequence of events arranged in between time and weather with the help of a scale for studying the past's, present and future movements of monsoon of a country and its relationship with other weather problem and natural calamities.

**2.1. Global Monsoon Time Scales**

African Monsoon Time Scale  
North American Monsoon Time Scale  
Asian Monsoon Time Scale  
Australian Monsoon Time Scale  
European Monsoon Time Scale

**2.2. Regional Monsoon Time Scales**

North American Monsoon Time Scale  
North African Monsoon Time Scale  
Indian Monsoon Time Scale  
Western North Pacific Monsoon Time Scale  
South American Monsoon Time Scale  
South African Monsoon Time Scale  
Australian Monsoon Time Scale  
East Asian Monsoon Time Scale

**2.3. Sub-Regional Monsoon Time Scales**

South Asian Monsoon Time Scale  
Maritime Continent Monsoon Time Scale  
East African Monsoon Time Scale  
West African Monsoon Time Scale  
Indo-Australian Monsoon Time Scale  
Asian-Australian Monsoon Time Scale  
Malaysian Australian Monsoon Time Scale  
Northern Australian Monsoon Time Scale  
Arizona Monsoon Time Scale  
Mexican Monsoon Time Scale  
South-West Monsoon Time Scale  
North-East Monsoon Time Scale  
South East Asian Monsoon Time Scale

Prepare the Global Monsoon Time Scale having 365 horizontal days from March 21<sup>st</sup> to next year March 20<sup>th</sup> of a required period comprising of a large time and weather have been taken and framed into a square graphic scale. The main weather events if any

of the country such as Floods etc. have been entering on the scale as per date and month of the each and every year. If we have been managing the scale of a country in this manner continuously, we can study the past, present and future movements of Floods of a

country. I have invented the following global, regional and sub-regional monsoon time scales.

### **3. Indian Monsoon Time Scale:**

**3.1. Construction:** For example, I have prepared the Indian Monsoon Time Scale for study, estimate and predict the Indian monsoon system. Prepare the Scale having 365 horizontal days from 1<sup>st</sup> April to next year March 31<sup>st</sup> of 128 years from 1888 to 2016 for the required period comprising of large time and weather have been taken and framed into a square graphic scale. The monsoon pulses in the form of low pressure systems over the Indian region have been entering on the scale in stages by 1 for low, 2 for depression, 3 for storm, 4 for severe storm and 5 for severe storm with core of hurricane winds pertaining to the date and month of the each and every year. If we have been managing the scale in this manner continuously, we can study the past's present's and future's of the India monsoon and its relationship with rainfall and other weather problems & natural calamities in India.

**3.2. Analysis:** The Indian Monsoon Time Scale reveals many secrets of the monsoon & its relationship with rainfall & other weather problems and natural calamities. For example, some bands, clusters and paths of low pressure systems along with the main paths of the Indian Monsoon (South-west monsoon and north-east monsoon) clearly seen in the map of the Indian monsoon it have been some cut-edge paths passing through its systematic zigzag cycles in ascending and ascending order which causes heavy rains & floods in some years and droughts & famines in another years according to their travel. For example, during 1871-1990's the main path of the Indian Monsoon was rising over June, July, August and

creating heavy rains and floods in most years. During 1900-1920's it was falling over August, September and causing low rainfall in many years, During 1920-1965's, it was rising again over July, August, September and resulting good rainfall in more years. During 1965-2004's it was falling over September and causing low rainfall and droughts in many years. At present it is rising upwards over June, July, August, and will be resulting heavy rains & floods in coming years during 2004-2060.

**4. Hazard Detection Method:** The tracking date of main path & other various paths such as south-west monsoon and north-east monsoon etc., of the Indian Monsoon denotes the onset of the monsoon, monsoon pulses or low pressure systems, storms and its consequent secondary hazard Floods etc.. And also we can find out many more secrets of the Indian monsoon such as droughts, famines, cyclones, heavy rains, floods, real images of the Indian Monsoon, and onset & withdrawals of south west monsoon and north-east monsoon etc. by keen study of the Indian Monsoon Time Scale.

For example, the date of tracking ridge of path is the sign to the impending cyclone and its secondary consequent hazard cyclone etc.

Another example, the thin and thick markers on the upper border line of the Indian monsoon time scale are the signs to the impending heavy rains & floods and droughts & floods. The thick marking of clusters of low pressure systems on the Indian monsoon time scale is the sign to the impending heavy rains and floods and the thin marking of clusters of low pressure systems on the Indian monsoon time scale is the sign to the impending droughts and famines.

Furthermore example, the main passage of line of monsoon travel from June to September and September to June are also signs to impending weather conditions of a country. For example, during 1871-1990's the main path of the Indian Monsoon was rising over June, July, August and creating heavy rains and floods in most years. During 1900-1920's it was falling over August, September and causing low rainfall in many years. During 1920-1965s, it was rising again over July, August, and September and resulting good rainfall in more years. During 1965-2004's it was falling over September and causing low rainfall and droughts in many years. At present it is rising upwards over June, July, August, and will be resulting heavy rains & floods in coming years during 2004-2060 in India.

These are some examples only. We can find out many more secrets of a country weather conditions by keen study of its monsoon time scale.

**5. Principle:** This is an Astrogeophysical / Astrometeorological phenomenon of effects of astronomical bodies and forces on the earth's geophysical atmosphere. The cause is unknown however the year to year change of movement of axis of the earth inclined at  $23\frac{1}{2}$  degrees from vertical to its path around the sun does play a significant role in formation of clusters, bands & paths of the Indian Monsoon and stimulates the Indian weather. The inter-tropical convergence zone at the equator follows the movement of the sun and shifts north of the equator merges with the heat low pressure zone created by the rising heat of the sub-continent due to direct and converging rays of the summer sun on the India Sub-Continent and develops into the monsoon trough and maintain monsoon circulation.

4/15/2017

**6. Conclusion:** We can make many more changes in the Global Monsoon Time Scale thus bringing many more methods can be designed to predict the Floods in advance.
