Abstract: An Electric Storm is more commonly known as thunders and lightnings storms. An Electric Storm may or may not present thunder, but lightning can still occur in the absence of thunder. Thunder is a direct result of lightning and occurs as clouds are separated and rejoin during an Electric Storm. In addition to thunder and lightning, an Electric Storm may also include wind, hail, rain or snow. An Electric Storm is created from the combination of atmospheric processes and dry air. The friction created between different climatic occurrences creates build up of energy which result in an Electric Storm. Electric Storm can cause a lot of damage to homes, start fires and even kill people in the right situations.

Lightning prediction system detects atmospheric conditions likely to produce lightning strikes and sounds an alarm, warning those nearby that lightning is imminent and giving them the chance to find safety before the storm arrives in the area. I have conducted many studies on the Electric Storms. Global Monsoon Time Scale may be useful to predict the electric storms.

Key Words: Global Monsoon Time Scale, Electric Storms.

1. Introduction: By establishing the Global Monsoon Time Scales in accordance with the conditions of a country and maintaining, impending Electric Storms can be studied, estimated and predicted in advance. Here shows an example of method to study and predict such weather conditions.

2. Global Monsoon Time Scale: The global Monsoon Time Scale – a Chronological sequence of events arranged in between time and weather with the help of a scale for studying the past's, present and future movements of monsoon of a country and its relationship with other weather problem and natural calamities.

2.1. Global Monsoon Time Scales

- African Monsoon Time Scale
- North American Monsoon Time Scale
- Asian Monsoon Time Scale
- Australian Monsoon Time Scale
- European Monsoon Time Scale

2.2. Regional Monsoon Time Scales

- North American Monsoon Time Scale
- North African Monsoon Time Scale
- Indian Monsoon Time Scale
- Western North Pacific Monsoon Time Scale
- South American Monsoon Time Scale
- South African Monsoon Time Scale
- Australian Monsoon Time Scale
- East Asian Monsoon Time Scale

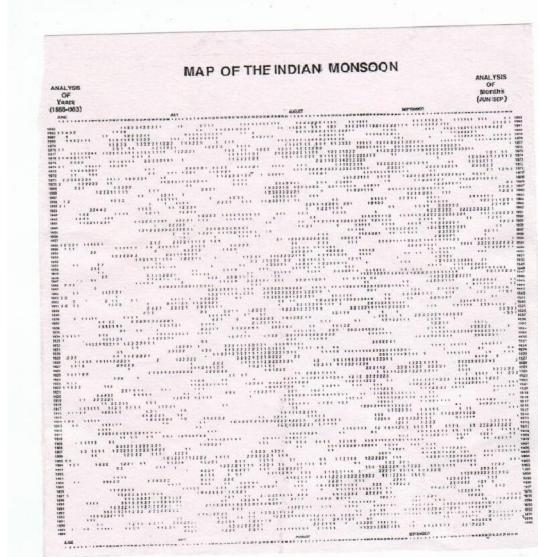

2.3. Sub-Regional Monsoon Time Scales

- South Asian Monsoon Time Scale
- Maritime Continent Monsoon Time Scale
- East African Monsoon Time Scale
- West African Monsoon Time Scale
- Indo-Australian Monsoon Time Scale
- Asian-Australian Monsoon Time Scale
- Malaysian Australian Monsoon Time Scale
- Northern Australian Monsoon Time Scale
- Arizona Monsoon Time Scale
- Mexican Monsoon Time Scale
- South-West Monsoon Time Scale
- North-East Monsoon Time Scale
- South East Asian Monsoon Time Scale

3. Indian Monsoon Time Scale:

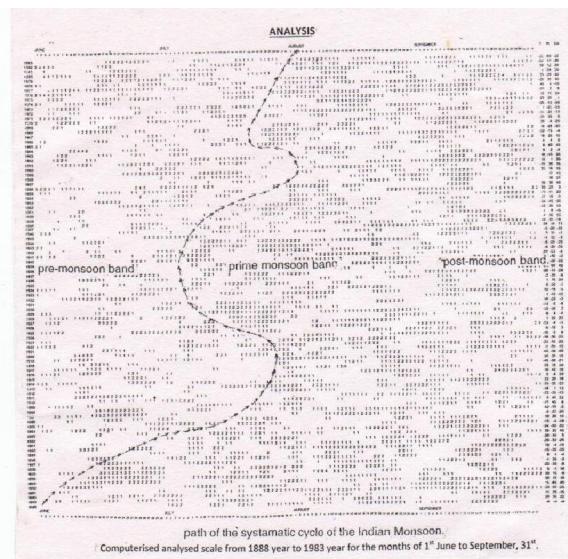

3.1. Construction: For example, I have prepared the Indian Monsoon Time Scale for study, estimate and

predict the Indian monsoon system. Prepare the Scale having 365 horizontal days from 1st April to next year March 31st of 128 years from 1888 to 2016 for the required period comprising of large time and weather have been taken and framed into a square graphic scale. The monsoon pulses in the form of low pressure systems over the Indian region have been entering on the scale in stages by 1 for low, 2 for depression, 3 for storm, 4 for severe storm and 5 for severe storm with core of hurricane winds pertaining to the date and month of the each and every year. If we have been managing the scale in this manner continuously, we can study the past's present's and future's of the India monsoon and its relationship with rainfall and other weather problems & natural calamities in India.

3.2. Analysis: The Indian Monsoon Time Scale reveals many secrets of the monsoon & its relationship with rainfall & other weather problems and natural calamities. For example, some bands, clusters and paths of low pressure systems along with the main paths of the Indian Monsoon (South-west monsoon and north-east monsoon) clearly seen in the map of the Indian monsoon it have been some cut-edge paths passing through its systematic zigzag cycles in ascending and ascending order which causes heavy rains & floods in some years and droughts & famines in another years according to their travel. For example, during 1871-1990's the main path of the Indian Monsoon was rising over June, July, August and creating heavy rains and floods in most years. During 1900-1920's it was falling over August, September and causing low rainfall in many years, During 1920-1965's, it was rising again over July, August, September and resulting good rainfall in more years. During 1965-2004's it was falling over September and causing low rainfall and droughts in many years. At

present it is rising upwards over June, July, August, and will be resulting heavy rains & floods in coming years during 2004-2060.

4. Hazard Detection Method: The tracking date of main path & other various paths such as south-west monsoon and north-east monsoon etc., of the Indian Monsoon denotes the onset of the monsoon, monsoon pulses or low pressure systems, storms and its consequent secondary hazard Electric Storms etc.. And also we can find out many more secrets of the Indian monsoon such as droughts, famines, cyclones, heavy rains, floods, real images of the Indian Monsoon, and onset & withdrawals of south west monsoon and north-east monsoon etc. by keen study of the Indian Monsoon Time Scale.

For example, the date of tracking ridge of path is the sign to the impending cyclone and its secondary consequent hazard cyclone etc.

Another example, the thin and thick markers on the upper border line of the Indian monsoon time scale are the signs to the impending heavy rains & floods and droughts & floods. The thick marking of clusters of low pressure systems on the Indian monsoon time scale is the sign to the impending heavy rains and floods and the thin marking of clusters of low pressure systems on the Indian monsoon time scale is the sign to the impending droughts and famines.

Furthermore example, the main passage of line of monsoon travel from June to September and September to June are also signs to impending weather conditions of a country. For example, during 1871-1990's the main path of the Indian Monsoon was rising over June, July, August and creating heavy rains and floods in most years. During 1900-1920's it was falling over August, September and causing low rainfall in many years.

rainfall in many years. During 1920-1965's, it was rising again over July, August, September and resulting good rainfall in more years. During 1965-2004's it was falling over September and causing low rainfall and droughts in many years. At present it is rising upwards over June, July, August, and will be resulting heavy rains & floods in coming years during 2004-2060 in India.

These are some examples only. We can find out many more secrets of a country weather conditions by keen study of its monsoon time scale.

5. Principle: This is an Astrogeophysical / Astrometeorological phenomenon of effects of astronomical bodies and forces on the earth's geophysical atmosphere. The cause is unknown however the year to year change of movement of axis of the earth inclined at 23½ degrees from vertical to its path around the sun does play a significant role in formation of clusters, bands & paths of the Indian Monsoon and stimulates the Indian weather. The inter-tropical convergence zone at the equator follows the movement of the sun and shifts north of the equator merges with the heat low pressure zone created by the rising heat of the sub-continent due to direct and converging rays of the summer sun on the India Sub-Continent and develops into the monsoon trough and maintain monsoon circulation.

6. Conclusion: We can make many more changes in the Global Monsoon Time Scale thus bringing many

more methods can be designed to predict the Electric Storms in advance.
